

Class STUDY EXECUTION: PATIENT RECRUITMENT

Systems of Interest:

Query Patient Screening Facilities for Potential Study-Subjects

Query Patient Screening Facilities for Potential Study-Subjects

Trigger

A Sponsor begins formulation of the patient recruitment strategy for a new study.

Primary Scenario

The system selects a study and study version from a USDM-compliant information stream and extracts the study-subject Inclusion/Exclusion (I/E) criteria. The information is packaged and transmitted to participating Patient Screening Facilities where it is used to query health record systems for patients that meet the I/E criteria. The screening facilities, following relevant national/regional patient data privacy laws and taking into account all informed consent considerations, return de-identified, summary-level information to the Sponsor in response to the query. The returned results support calculation of patient recruitment estimates.

Result

Sponsor acquires data for patient population sizes strategy and builds study patient recruitment models.
